

## Diagram

## Reflection

1. What is defined in the controllers?  
CRUD functionality was added to the controller ( Create, Read, Update and Delete) to the server.
2. How requests are handled by the controller?  
The controller handles HTTP requests - which can be modified by the middleware - and defines the functionality that will eventually provide a response and / or modify the data in the database.
3. How middleware is used to modularize the code?  
We use Express, a Node.js web app framework that contains features that minimize the amount of code that we need for the middleware to communicate with the server. Express allows us to send the static files to the browser (e.g. HTML, js, and CSS files). Express also can reroute data.
